

Attention: Maxon Australia

We have now completed and tested the project that we undertook for our customer and they are very happy with the features of your maXwan and maXvpn systems. These features will ensure the safety, security and integrity of the data they will need to retrieve from the control system. With your system we have given them a secure path through their Internet Browser to access the data from different areas of the world at the same time.

An overview of the hardware is shown below and comprises of an Allen Bradley Compact Logix PLC with a remote Device Net Node (not shown in the picture), Red Lion Data Station (Data Logging Device and Web Server), Maxon Unimax Modem and a Stratix Unmanaged Hub.

The only limitation to this system is the Red Lion Data Station can only handle four users at any one time, so you can have more than four maXvpn's but only use four at any one time. Through the maXvpn we can access the modem configuration, download the data from the data station and also access the PLC if needed which makes for a very neat solution for design, running, troubleshooting and upgrading at a later date.
